Hi Dan and Bakhtiyor,

I just wanted to note that in doing the numerous revisions and updates to the application documents, we missed a couple of changes.

The PDR provides a granular estimate of 120,000 m3 from the Town Quarry and 240,000 m3 from the new quarry. This is consistent with the quarry development plan which says 240,000 m3 from the new quarry but we forgot to update the quarry permit which still says 300,000 m3. That should have been changed to 240,000 m3 to match the PDR and the quarry plan.

Also the estimate of 35,200 kg of explosives in the spill response plan is incorrect. That was meant to be updated but then was missed. The estimated volume of explosives required is 0.9 kg of explosives/m3 granular * 360,000 m3 granular = 324,000 kg of explosives.

Both of the estimated volumes for granular and explosives though are subject to change as the project undergoes final design.

Sorry about the errors.
