Methods & Techniques	A				
Facilities	A				

Explanatory Remarks – KM 178.1

During the inspection on March 16, 2018 at the Wrangling River (KM 178.1) granular storage site there is a concern that the material is stored too close to the Wrangling River water course. The material is approximately 35 meters from the water course below at this time. Note: work in or near a Watercourse may require a water licence and/or DFO authorization.

During freshet the material at the site must be monitored to ensure no sediment is being deposited into the river below. If the sediment is starting to travel into the river, preventative measures must be conducted to ensure no further sediment is deposited in to the river.

The site is clean and organized and there is no other concerns observed by the inspector at this time. There will be 800 cubic meters of granular material hauled to this site.
