Distribution List

A summary of the Giant Mine Remediation Project ambient air quality monitoring program for the week ending August 1, 2020 is as follows:

### Site Perimeter Stations

- No 15-minute average particulate matter less than 10 microns in diameter (PM<sub>10</sub>) concentrations above the established Risk Based Action Level (RBAL) of 159 µg/m<sup>3</sup> were measured at the site perimeter monitoring stations during the week. PM<sub>10</sub> concentrations measured at the site perimeter monitoring locations during the week were typical of seasonal background concentrations;
- No 15-minute average total suspended particulate (TSP) concentrations above the established RBAL of 333 µg/m<sup>3</sup> were measured at the site perimeter monitoring stations during the week. TSP concentrations measured at the site perimeter monitoring locations during the week were typical of seasonal background concentrations;
- Laboratory results for integrated TSP, PM<sub>10</sub>, and trace metals (including arsenic) analyses from samples collected on July 8, 11, and 14, 2020 at the site perimeter monitoring stations were less than the analytical detection limit and/or below the referenced standard. Laboratory analyses of integrated 24-hour arsenic, PM<sub>10</sub>, and TSP filter samples collected at the site perimeter stations after July 14, 2020 are pending.

### Community Stations

- No continuous PM<sub>2.5</sub> or PM<sub>10</sub> 24-hour average concentrations above the referenced standards for each were measured at any of the community stations during the week. PM<sub>2.5</sub> and PM<sub>10</sub> concentrations during the week were typically representative of seasonal background concentrations;
- Laboratory results for integrated TSP, PM<sub>10</sub>, and trace metals (including arsenic) analyses from samples collected on July 8, 11, 14, and 17, 2020 at the community stations were less than the analytical detection limit and/or below the referenced standard. Laboratory analyses of community station filters collected after July 17, 2020 are pending;
- There were no NO<sub>2</sub> concentrations measured at the Niven Lake Community Station above the NWT Ambient Air Quality 24-hour Standard of 106 parts per

billion (ppb) or the one-hour Standard of 213 ppb during the week. Table 1 summarizes each day's maximum hourly concentration and each day's 24-hour average concentration at the Niven Lake community station during the week.

Table 1  
Niven Lake Community Station NO<sub>2</sub> Concentrations

Date	Maximum One-hour Average (ppb)	24-hour Average (ppb)
July 26, 2020	0.4	0.0
July 27, 2020	1.3	0.2
July 28, 2020	2.0	0.5
July 29, 2020	1.4	0.0
July 30, 2020	0.2	0.0
July 31, 2020	2.3	0.6
August 01, 2020	0.8	0.0

General Operation

- Integrated sampling for TSP, PM<sub>10</sub>, and trace metals (including arsenic) was conducted on July 26, 29, and August 1, 2020. The next regularly scheduled sampling is August 4, 2020;
- Data completeness for the reporting period was 99.98% for continuous TSP and 100% for continuous PM<sub>10</sub> concentrations measured at the site perimeter monitoring stations;
- The AAQM program operated as specified during the week ending August 1, 2020, with the following exceptions:
  - One hour of PM<sub>10</sub> was invalidated at YKB on July 31, 2020 during routine maintenance on the sampling system.

Sincerely,

Natalie Plato  
Deputy Director  
Giant Mine Remediation Project
