

**From:** Geneva Irwin  
**Subject:** Air Quality Monitoring Weekly Summary - Week Ending in October 8  
**Date:** Thursday, October 13, 2016 4:24:35 PM  
**Attachments:** [October 8.pdf](#)

---

Good Morning,

A summary of the Giant Mine ambient air quality monitoring program (AQM) for the week ending October 8, 2016 is as follows:

Fenceline Network:

- 15-minute average particulate matter less than 10 microns in diameter (PM<sub>10</sub>) concentrations above the established Risk Based Action Level (RBAL) of 159 µg/m<sup>3</sup> were measured at the fenceline monitoring stations during the week. PM<sub>10</sub> concentrations measured at fenceline locations during the week were typical of seasonal background concentrations;
- 15-minute average total suspended particulate (TSP) concentrations above the established fenceline RBAL of 333 µg/m<sup>3</sup> were measured at the fenceline monitoring stations during the week. TSP concentrations measured at the fenceline locations during the week were typical of seasonal background concentrations;
- Laboratory results of arsenic concentrations from samples collected on August 30, September 15, 2016 at the Fenceline E-Sampler locations were less than the analytical detection limit and/or below the referenced standards. Laboratory analyses of arsenic filter samples collected after September 15, 2016 are pending.

Community Stations:

- 24-hour average concentrations of PM<sub>2.5</sub> and PM<sub>10</sub> were measured above the referenced standards at the community stations during the week. PM<sub>2.5</sub> and PM<sub>10</sub> concentrations during the week were typically representative of seasonal background concentrations;
- Laboratory analysis of community station filters collected after September 6, 2016 are pending:
  - Laboratory analyses of asbestos samples collected at the community stations on September 15, 2016 are pending.

Stope Borehole Drilling Program:

- There was no air quality monitoring specific to the stope borehole drilling program conducted during the week, as drilling operations have concluded.
- Laboratory results of arsenic concentrations from samples collected on September 15, 2016 at the stope borehole locations were less than the analytical detection limit and/or below the referenced standards. Laboratory analyses of arsenic filter samples collected after September 15, 2016 are pending.

General Operation:

- The AQM program operated as specified during the week ending October 8, 2016, with the following exception:
  - Fenceline DustTrak instruments have been affected by an intermittent internal software error causing sporadic loss of PM<sub>10</sub> and TSP 15-minute concentration data. SLR has been working with the manufacturer to identify and correct this issue, but has yet to determine a cause. Backup E-Sampler PM<sub>10</sub> instruments have been collocated with the DustTraks at site F-Marina and G-West to provide data during periods affected by the DustTrak instrument software error.

Best,

Natalie Plato

**RE: Air Quality Reports for the Week of October 8, 2016.**

A summary of the Giant Mine ambient air quality monitoring program (AQM) for the week ending October 8, 2016 is as follows:

Fenceline Network:

- No 15-minute average particulate matter less than 10 microns in diameter (PM<sub>10</sub>) concentrations above the established Risk Based Action Level (RBAL) of 159 µg/m<sup>3</sup> were measured at the fenceline monitoring stations during the week. PM<sub>10</sub> concentrations measured at fenceline locations during the week were typical of seasonal background concentrations;
- No 15-minute average total suspended particulate (TSP) concentrations above the established fenceline RBAL of 333 µg/m<sup>3</sup> were measured at the fenceline monitoring stations during the week. TSP concentrations measured at the fenceline locations during the week were typical of seasonal background concentrations;
- Laboratory results of arsenic concentrations from samples collected on August 30, September 15, 2016 at the Fenceline E-Sampler locations were less than the analytical detection limit and/or below the referenced standards. Laboratory analyses of arsenic filter samples collected after September 15, 2016 are pending.

Community Stations:

- No 24-hour average concentrations of PM<sub>2.5</sub> and PM<sub>10</sub> were measured above the referenced standards at the community stations during the week. PM<sub>2.5</sub> and PM<sub>10</sub> concentrations during the week were typically representative of seasonal background concentrations;
- Laboratory analysis of community station filters collected after September 6, 2016 are pending;
  - Laboratory analyses of asbestos samples collected at the community stations on September 15, 2016 are pending.

Stope Borehole Drilling Program:

- There was no air quality monitoring specific to the stope borehole drilling program conducted during the week, as drilling operations have concluded.
- Laboratory results of arsenic concentrations from samples collected on September 15, 2016 at the stope borehole locations were less than the analytical detection limit and/or below the referenced standards. Laboratory analyses of arsenic filter samples collected after September 15, 2016 are pending.

General Operation:

- The AQM program operated as specified during the week ending October 8, 2016, with the following exception:
  - Fenceline DustTrak instruments have been affected by an intermittent internal software error causing sporadic loss of PM<sub>10</sub> and TSP 15-minute concentration data. SLR has been working with the manufacturer to identify and correct this issue, but has yet to determine a cause. Backup E-Sampler PM<sub>10</sub> instruments have been collocated with the DustTraks at site F-Marina and G-West to provide data during periods affected by the DustTrak instrument software error.

Sincerely,
