Distribution List

A summary of the Giant Mine Remediation Project ambient air quality monitoring program for the week ending November 7, 2020 is as follows:

Site Perimeter Monitoring Network

- No 15-minute average particulate matter less than 10 microns in diameter (PM₁₀) concentrations above the established Risk Based Action Level (RBAL) of 159 µg/m³ were measured at the site perimeter monitoring stations during the week. PM₁₀ concentrations measured at the site perimeter monitoring locations during the week were typical of seasonal background concentrations;
- No 15-minute average total suspended particulate (TSP) concentrations above the established RBAL of 333 µg/m³ were measured at the site perimeter monitoring stations during the week. TSP concentrations measured at the site perimeter monitoring locations during the week were typical of seasonal background concentrations;
- Laboratory results for integrated TSP, PM₁₀, and trace metals (including arsenic) analyses from samples collected on October 18, 21, and 24 2020 at the site perimeter monitoring stations were less than the analytical detection limit and/or below the referenced standard. Laboratory analyses of integrated filter samples collected at the site perimeter stations on September 27, October 8, and after October 24, 2020 are pending.

Community Station Monitoring Network

- No continuous PM_{2.5} or PM₁₀ 24-hour average concentrations above the referenced standards for each were measured at any of the community stations during the week. PM_{2.5} and PM₁₀ concentrations during the week were typically representative of seasonal background concentrations;
- Laboratory results for integrated TSP, PM₁₀, and trace metals (including arsenic) analyses from samples collected on October 15, 18, and 21, 2020 at the community stations were less than the analytical detection limit and/or below the referenced standard. Laboratory analyses of community station filters collected after October 21, 2020 are pending;
- There were no NO₂ concentrations measured at the Niven Lake Community Station above the NWT Ambient Air Quality 24-hour Standard of 106 parts per billion (ppb) or the one-hour Standard of 213 ppb during the week. Table 1

summarizes each day's maximum hourly concentration and each day's 24-hour average concentration at the Niven Lake community station during the week.

Table 1
Niven Lake Community Station NO₂ Concentrations

Date	Maximum One-hour Average (ppb)	24-hour Average (ppb)
November 01, 2020	22.5	6.4
November 02, 2020	2.0	0.3
November 03, 2020	16.9	5.4
November 04, 2020	7.0	1.7
November 05, 2020	1.4	0.4
November 06, 2020	14.8	4.1
November 07, 2020	20.2	0.0

General Operation

- Integrated sampling for TSP, PM₁₀, and trace metals (including arsenic) was conducted on November 2 and 5, 2020. The next regularly scheduled sampling is November 8, 2020;
- Data completeness for the reporting period was 98.93% for continuous TSP and 99.67% for continuous PM₁₀ concentrations measured at the site perimeter monitoring stations;
- The AAQM program operated as specified during the week ending November 11, with the following exception:
 - Six hours of PM₁₀ data at the NDL community station were invalidated on November 3, 2020 due to a tape error in the instrument;
 - The TSP sampler at site perimeter station E-A1C1 did not record data from 07:45 to 12:45 on November 1, 2020 due to a battery malfunction;
 - The TSP sampler at site perimeter station E-A1C1 did not record data from 02:30 to 06:45 on November 4, 2020 due to a battery malfunction.

Sincerely,

Natalie Plato
Deputy Director
Giant Mine Remediation Project
