At the end of May (letter dated May 28) I asked for comments on DDMI's revised 2007 Hazardous Materials Plan and 2007 Operational Phase Contingency Plan. I noted in that letter that Diavik would give us a summary of what changes were made to these plans. DDMI has now provided this summary of changes (see the email below).

These plans were also revised the year before but for various reasons did not go before the Board. I distributed a summary of changes for the 2006 revised plans (letter from me, February 14, 2007). If you would like a copy of that summary as well, let me know.

Hope this helps with your review. (As noted in the May 28th letter, comments on these two plans are due by July 16, 2007.)

Patty

Hi Patty:

Below is a summary of changes to the two plans (OPCP and the HMMP). In general the text stayed the same, however we updated most of the tables with material quantities and all of the maps associated with the reports.

**Operational Phase Contingency Plan**

**Changes that were incorporated in version 10 (March 2007):**

- The distribution list was updated.
- The response flow chart was updated to more accurately reflect the sequence of actions and responsibilities, depending on the nature of the incident (figure 2).
- The roles and responsibilities section was updated to reflect new positions and
organizational changes within DDMI (section 2.2)

- Table 4.1 was updated with the types and quantities of hazardous materials stored on site. The main updates were increases in the quantities of diesel and ammonium nitrate on site as well as the addition and cement.

- The ERT training section was updated.

- Appendix A was updated - this comprises the general Site Layout and Spill Response Locations (map).

- Appendix C was updated with sensitive wildlife/fish area maps, updated to reflect changes with the construction of the new A418 dike and pit area

Hazardous Materials Management Plan

Changes that were incorporated in version 10 (March 2007):

- The distribution list was updated.

  - Table 1.1 was updated with the types and quantities of hazardous materials stored on site. The main updates were increases in the quantities of diesel and ammonium nitrate on site as well as the addition of bentonite and cement.

- A reference was made to the Disaster Management Response Plan (DMRP) and Emergency Management Plans in terms of outlining the organization of response and key personnel/responsibilities in the event of a major spill. These plans were updated in 2007. (section 3.1)

- Figure 1, the site layout, was updated for 2007

- Section 6.2 was updated to reflect the change in explosives used within the Mine (i.e, change from 65% emulsion -35% ANFO mixture to 80% emulsion – 20% ANFO.)

Sorry for the delay, the new Quality Assurance Project Plan for the AEMP and the Construction Environmental Management Plan have been consuming most of my time these days.

Cheers,
Scott
